Concept 11: AI Desktop Apps and Permissions

SCENARIO

Sarah is a freelance designer. She just installed an AI desktop app and wants it to immediately reorganize her entire hard drive with full read/write access on day one.

1 What is the biggest risk with Sarah's approach?

- A** The AI will create duplicate files across the drive.
- B** Files deleted by the AI will bypass the recycle bin and be permanently lost.
- C** The AI will slow down her internet connection.
- D** The AI will automatically upload her files to the cloud.

SCENARIO

Ahmed wants to use an AI desktop app to sort 300 project files. He is deciding whether to let the AI start immediately or request a plan first and review it before execution.

2 According to Module 4, what is the correct safe workflow Ahmed should follow?

- A Grant full access and let the AI execute immediately for efficiency.
- B Delete everything first, then let the AI reorganize from scratch.
- C Describe the task → Request a plan → Review and edit the plan → Authorize execution.
- D Trust the AI company's reputation and skip the review step.

SCENARIO

Lena used an AI desktop app to clean up her Documents folder. The next day she realized some important contracts are missing and cannot find them in the Recycle Bin.

3 Why are the deleted files NOT in Lena's Recycle Bin?

- A The files were moved to the cloud automatically.
- B AI desktop apps typically bypass the Recycle Bin, causing permanent deletion.
- C The Recycle Bin reached its size limit and auto-emptied.
- D The files were encrypted and hidden in a subfolder.

SCENARIO

Marcus is setting up an AI desktop app for the very first time. He is unsure what level of permission

to grant the app on his computer.

4 What permission level should Marcus start with for the initial session?

A Full administrator rights across the entire system.

B Read-only access to a single small folder.

C Read/write access to all project folders.

D Network and internet access only.

SCENARIO

An AI desktop app edited 50 Word documents for Julia, reformatting them. She later realized the changes were wrong and wants to undo them, but there is no undo option available.

5 Why can Julia NOT restore the original versions of her documents?

A The AI locked the files in read-only mode after editing.

B AI-edited files have no version history unless external version control is enabled.

C The files were automatically compressed after editing.

D Version history only works on images, not documents.

SCENARIO

Tom wants to give an AI desktop app more permissions because the company that made it is very well-known and trustworthy. His colleague suggests waiting and observing reliability first.

6 Whose approach aligns with Module 4's permission escalation model?

- A** Tom — company reputation is a reliable basis for granting full access.
- B** The colleague — trust should grow based on demonstrated reliability, not brand name.
- C** Both approaches are equally valid.
- D** Neither — no AI tool should ever be trusted with permissions.

SCENARIO

A company is onboarding an AI file management tool. They have designed a three-stage permission plan: Stage 1 is read-only on one folder, Stage 2 is read/write in specific folders after testing, and Stage 3 is tool-specific scoped permissions.

7 This three-stage plan is best described as which concept from Module 4?

- A** Bulk operation framework
- B** The Permission Ladder progression
- C** Model selection strategy
- D** Cost-speed hierarchy

SCENARIO

A consultant had 240 client PDFs scattered across folders from the past four years — a task she had labeled "someday" for years. She used an AI desktop app and the task was finished in 15 minutes.

8 What key capability of AI desktop apps does this scenario demonstrate?

- A The ability to generate new documents automatically.
- B File reorganization assistance that can complete multi-year backlogs in minutes.
- C The ability to email files to clients automatically.
- D Converting PDFs to Word documents.

SCENARIO

David has design files, invoices, and contracts spread across 12 different folders. He asks his AI desktop app to find all files related to "Project Alpha" across every folder.

9 Which AI desktop app capability is David using?

- A Web scraping
- B Cross-referencing related files across folders
- C Cloud synchronization
- D File encryption

SCENARIO

An AI proposes moving 500 files into new folders. Instead of clicking "Execute," Nina spends 10 minutes reviewing and removing 3 steps from the proposed plan before approving.

10 Why is Nina's review step critically important according to Module 4?

- A** It speeds up the AI's processing time.
- B** It allows her to verify and control AI actions before irreversible changes occur.
- C** It trains the AI to be smarter for future tasks.
- D** It reduces the cost of running the AI tool.

SCENARIO

An employee needs an AI to rename files in one specific folder. His manager suggests giving the AI access to the entire company shared drive "just to be safe in case it needs to reference other files."

11 Which principle from Module 4 does the manager's suggestion violate?

- A** Broader access improves AI efficiency, so the manager is correct.
- B** Permission scope should match task scope — it should not exceed what is needed.
- C** AI should always have maximum access for best results.
- D** The manager is correct; more access reduces risk.

SCENARIO

After 3 successful read-only sessions with an AI app, Maya wants to move to the next level of the permission ladder.

12 According to the permission ladder, what should Maya's next permission level be?

- A** Full system administrator rights immediately.

- B** Read/write access within specific scoped folders.
- C** Internet access permission.
- D** No change — she should stay at read-only forever.

SCENARIO

A startup is evaluating AI desktop apps. One employee asks, "Can these apps actually move and rename files, or do they just suggest changes in a chat window?"

13 What is the correct answer based on Module 4?

- A** They only suggest changes — a human must perform every action manually.
- B** With permission, AI desktop apps can rename, move files, and create directories directly.
- C** They can only delete files, not move them.
- D** They only work through browser extensions, not locally.

SCENARIO

Before running a bulk file operation, James receives a proposed action list from his AI app showing 47 steps. He notices step 23 would rename a folder his entire team depends on.

14 What should James do at this point in the safe workflow?

- A** Execute the full plan — the AI knows best.
- B** Edit the plan by removing or changing step 23, then authorize execution.

- C** Cancel the entire task permanently.
- D** Give the AI admin rights so it can handle exceptions itself.

SCENARIO

A content creator asks her AI desktop app to look through her "2024 Videos" folder and give her a summary of what projects she worked on that year.

15 Which AI desktop app capability is being used here?

- A** Autonomously summarizing folder contents to generate a work history.
- B** Uploading the folder to a cloud database for analysis.
- C** Encrypting the folder for backup purposes.
- D** Converting video files to text documents.

SCENARIO

An AI desktop app has successfully completed 5 small tasks for Rachel with zero errors. She now wants to assign it a larger, more complex file operation in a broader folder.

16 According to Module 4, when is it appropriate to expand AI access?

- A** Immediately — on the first day of use.
- B** After the AI has demonstrated consistent reliability through successful runs.
- C** Only when the AI company releases a new version.

- D** Never — access should remain the same forever.

SCENARIO

An AI desktop app tells a user: "I will now move 200 files to new folders." The user clicks OK without reading the proposed file list.

17 Which step of the recommended safe workflow did this user skip?

- A** Describing the task
- B** Reviewing and editing the proposed plan before authorizing execution
- C** Requesting a plan from the AI
- D** Providing internet access to the app

SCENARIO

An AI edited 30 of Carlos's reports. He later realizes the AI made formatting errors throughout and wants to revert to the originals — but he finds he cannot.

18 What should Carlos have set up BEFORE allowing the AI to edit files?

- A** A faster internet connection
- B** An external version control system to preserve file history
- C** A second AI tool to monitor the first one

- D** A premium subscription to the AI tool

SCENARIO

An AI app presents a 30-step reorganization plan. The user is in a hurry and approves without reading — the AI then deletes a critical archive folder.

19 What was the root cause of this data loss?

- A** The AI had a software bug.
- B** The user skipped the visual review and approval step before execution.
- C** The internet connection failed mid-operation.
- D** The AI subscription expired during the task.

SCENARIO

A product manager asks an AI to look through her project folders and give her a summary of all the work she completed in the last 12 months.

20 How does the AI generate this work history summary?

- A** By checking the user's calendar app.
- B** By analyzing folder contents and file metadata to identify work patterns.
- C** By searching for the user's name on the internet.

- D** By reading the user's email inbox.

SCENARIO

A user tries to ask Claude's web interface to organize files on his laptop. Nothing happens. His friend says he needs a different type of tool for that task.

21 Why can't the standard chat interface perform this file organization task?

- A** Standard chat interfaces are less intelligent than desktop apps.
- B** Standard chat interfaces cannot access the local file system — only AI desktop apps with permissions can.
- C** The user's internet connection is too slow.
- D** File organization requires a paid subscription only available in chat interfaces.

SCENARIO

After months of reliable usage, an AI desktop app has earned maximum trust in a company. They want to assign it the highest level in the permission ladder.

22 What does the highest "trusted" stage of the permission ladder look like?

- A** Full delete rights across the entire server.
- B** Tool-specific scoped permissions — still bounded to relevant areas.
- C** Access to all employee email accounts.

D Unrestricted internet and banking access.

SCENARIO

A photographer has 4,000 images to rename using a consistent naming convention. She wants the AI to handle all of them in one go rather than doing them one-by-one.

23 What type of AI desktop app operation is she planning to use?

A A single file operation

B A cloud synchronization operation

C A bulk operation — performing actions on many files simultaneously

D An image generation operation

SCENARIO

The module describes a consultant who had been putting off organizing 240 client PDFs from four years of work. With AI file assistance, the task was completed in a single session.

24 How long did it take the AI to complete this four-year backlog?

A 4 hours

B 2 days

C 15 minutes

D 1 week

SCENARIO

A new user sits down with an AI desktop app for the first time. She is not sure what to do first — should she give permissions, ask it to act, or describe what she needs?

25 According to the safe workflow in Module 4, what is the very FIRST step she should take?

A Authorize the AI to begin executing immediately.

B Review the proposed plan.

C Describe the task clearly to the AI.

D Grant full system permissions upfront.

Concept 12: Cost, Speed, and Model Selection

SCENARIO

A student is writing a research paper and wants to iterate on her thesis statement many times per day using AI. She is worried about the cost adding up quickly.

26 Based on Module 4's cost hierarchy, should she be worried about text iteration costs?

A Yes — text is one of the most expensive AI modalities.

- B** No — text interactions cost fractions of a cent and complete in seconds, enabling 50+ daily iterations.
- C** Yes — text requires a premium subscription to use repeatedly.
- D** No — all AI modalities cost the same.

SCENARIO

A filmmaker is using AI to generate video clips for a commercial. He wants to iterate on the concept 20+ times like he does with text prompts. His budget is \$50.

27 Why is this video iteration strategy problematic according to Module 4?

- A** Video generation is free but very slow.
- B** Video generation costs many cents to dollars per clip and takes minutes — making 20+ iterations impractical on a \$50 budget.
- C** Video AI tools don't work on commercial projects.
- D** Video generation is only available on mobile devices.

SCENARIO

A law firm needs to analyze a 200-page legal document and produce a structured written summary. They are choosing between Claude, ChatGPT, and Gemini.

28 Based on mid-2026 model strengths in Module 4, which tool is the best fit?

- A** ChatGPT — it leads in image generation and voice.

- B** Gemini — it is best at Google Workspace integration.
- C** Claude — it excels at long-document analysis, reasoning, and structured writing.
- D** Meta AI — it is free and widely accessible.

SCENARIO

A marketing agency needs to create high-quality AI-generated product images and also have voice-based brainstorming sessions with their AI tool. They are selecting a primary AI platform.

29 Which AI tool is the strongest fit for their needs based on Module 4?

- A** Claude — it excels at diagram generation and structured analysis.
- B** ChatGPT — it leads in image generation quality and voice interaction.
- C** Gemini — it is strongest in deep research outputs.
- D** Meta AI — it offers the best image generation.

SCENARIO

A journalist needs to research a breaking news story by synthesizing the latest information from across the web and produce a deep research report. She is deciding which AI to use.

30 According to Module 4's mid-2026 snapshot, which AI is best suited for this task?

- A** Claude — best for complex code generation.
- B** ChatGPT — best for voice interaction.

- C** Gemini — excels at web search synthesis and deep research outputs.
- D** Meta AI — best for social media platform integration.

SCENARIO

A small business owner in a developing country uses WhatsApp to communicate with customers. He wants to experiment with AI but cannot afford a subscription service.

31 Which AI tool is the most accessible option for him based on Module 4?

- A** Claude — best for document reasoning.
- B** Meta AI — embedded across WhatsApp, Instagram, and Facebook, free without a subscription.
- C** Gemini — best for Google Workspace tasks.
- D** ChatGPT — offers the best voice experience.

SCENARIO

A developer has been using only Claude for every task for the past year — from coding to image generation to research — because she is "loyal" to one brand.

32 What does Module 4 say about this approach?

- A** Tool loyalty is smart — consistency improves AI performance.
- B** Only free tools should be used regardless of task.

- C** Avoid tool loyalty — select models based on task requirements and re-evaluate regularly since switching is free.
- D** Using one model is fine as long as it is the most expensive option.

SCENARIO

A designer wants to create a new brand logo using AI image generation. His colleague says, "You should spend a lot more time crafting the prompt upfront compared to when you write text prompts."

33 Why is the colleague's advice correct according to Module 4?

- A** Image prompts are simpler and need less thought than text prompts.
- B** Because iteration cost shapes strategy — image generation is slower and costs more, so upfront prompt investment is critical.
- C** Image generation AI tools are unreliable and need more prompts to work.
- D** All AI modalities require the same investment regardless of cost.

SCENARIO

An entrepreneur wants to quickly refine her startup pitch. She plans to iterate on the wording multiple times throughout the day using an AI text tool.

34 Approximately how many text iterations per day does Module 4 suggest are feasible?

- A** 5 iterations

- B** 10–15 iterations
- C** 50 or more iterations
- D** Only 1–2 iterations due to cost

SCENARIO

A student generating an AI image realizes halfway through that the style is wrong. He tries to stop the generation process early but cannot — he has to wait and pay for the full generation before trying again.

35 What image generation limitation does this scenario illustrate?

- A** Images can only be generated in black and white.
- B** Image generation has no early-stopping capability — the full generation must complete before retrying.
- C** Images generated by AI cannot be downloaded.
- D** Image generation requires a separate hardware device.

SCENARIO

A team argues about which AI model is universally "the best" for all their work tasks — writing, coding, research, and image creation. Each person has a different favorite.

36 What does Module 4 say about having one universally "best" AI model?

- A** Claude is universally the best for all tasks.

- B** No single model excels uniformly — capability distributions are jagged across different task types.
- C** The most expensive model is always the best.
- D** The most popular model is always the best choice.

SCENARIO

A content team uses only one AI tool and has never compared it to competitors. Their manager says they should regularly run the same prompts through 2–3 different platforms to evaluate performance.

37 Why does Module 4 recommend this multi-platform testing approach?

- A** To increase spending on AI tools.
- B** Because relative model strengths shift every few months — regular comparison keeps your tool selection optimal.
- C** Because running multiple tools simultaneously makes AI faster.
- D** To comply with government regulations on AI usage.

SCENARIO

Two years ago, AI image generation cost \$1 per image. A photographer now notices she can generate the same quality images for just a few cents. She wonders if this trend will continue.

38 What does Module 4 say about the trend in AI tool costs over time?

- A** AI costs are steadily increasing due to higher energy demands.

- B** AI costs are continuously declining, making creative applications increasingly accessible.
- C** AI costs have stabilized and will remain the same.
- D** AI costs are unpredictable and cannot be forecasted.

SCENARIO

A podcast producer uses AI voice tools to transcribe and generate spoken content. She is reviewing her monthly AI bill and trying to understand which modality is consuming her budget.

39 What does Module 4 say about the approximate cost of AI speech interactions?

- A** Speech is completely free across all platforms.
- B** Speech costs a few cents per minute — more than text but cheaper than image or video.
- C** Speech costs dollars per minute, making it the most expensive modality.
- D** Speech has the same cost as text — both are fractions of a cent.

SCENARIO

An art director submits an AI image prompt and waits. She notices the generation takes noticeably longer than a text response but much shorter than a video generation.

40 What is the typical image generation time according to Module 4's cost-speed hierarchy?

- A** Milliseconds — nearly instantaneous

B Tens of seconds

C Several hours

D Multiple days

SCENARIO

A tech blogger writes, "Claude was the best model for reasoning tasks six months ago, but things may have changed." His editor disagrees, saying model rankings are permanent.

41 Who is correct based on Module 4?

A The editor — model rankings are permanent and reliable long-term.

B The blogger — model leadership rotates every few months as capabilities evolve.

C Neither — model capabilities never change after launch.

D Both — rankings change every 10 years, which is frequent enough to matter.

SCENARIO

A researcher asks an AI tool to conduct a deep research task on climate policy. It takes several minutes and costs a fraction of a dollar. She wonders if this is normal.

42 What does Module 4 say about deep research modality costs and speed?

A Deep research takes seconds and is completely free.

- B** Deep research takes minutes and costs several cents to around a quarter dollar — which is normal.
- C** Deep research takes hours and costs several dollars.
- D** Deep research has the same cost and speed as basic text queries.

SCENARIO

A video production team is about to use AI to generate 15-second ad clips. A senior producer tells the team: "We cannot afford to iterate the way we do with text. Get the prompt right the first time."

43 What principle from Module 4 is the senior producer applying?

- A** All AI modalities support the same iteration strategy.
- B** Iteration cost shapes strategy — expensive modalities require heavier upfront prompt engineering investment.
- C** AI video tools don't accept detailed prompts.
- D** Video AI tools are always free, so iteration is never a concern.

SCENARIO

A company has used only ChatGPT for 2 years across all departments. When a colleague suggests trying Claude for their document analysis work, the team lead says "We're loyal to ChatGPT."

44 What does Module 4 say about this "tool loyalty" mindset?

- A** Tool loyalty is good — it builds expertise in one platform.

- B** Tool loyalty should be avoided — switching between tools is free and enables better task-specific results.
- C** Tool loyalty is acceptable if the tool has a good reputation.
- D** Companies should only use one paid tool to reduce billing complexity.

SCENARIO

A creative director is evaluating which AI modality — text, speech, image, or video — is the most expensive to iterate on when producing content.

45 Which modality is the most expensive and impractical to iterate on?

- A** Text
- B** Speech
- C** Image
- D** Video

SCENARIO

A new student is confused about what Module 4 of the AI Prompting 2026 course is about. She asks her instructor for a one-sentence summary of the module's core focus.

46 What is the core focus of Module 4?

- A** How to use AI to write poetry and creative fiction.

- B** How to work safely with AI desktop tools and how to choose the right AI model for different tasks.
- C** How to build AI applications using the Claude API.
- D** How to use AI for social media marketing campaigns.

SCENARIO

A software engineering team needs help generating structured API documentation and reviewing complex code logic. They want to pick the right AI model for the job.

47 Based on Module 4's mid-2026 model strengths, which tool is best suited for this engineering task?

- A** ChatGPT — strongest in image generation.
- B** Meta AI — embedded in WhatsApp for easy team communication.
- C** Claude — excels at code generation, reasoning, and structured document analysis.
- D** Gemini — best for social media content generation.

SCENARIO

A student is studying AI modality costs and must rank them from cheapest to most expensive for a quiz. She lists four options: text, speech, image, and video.

48 What is the correct order from cheapest to most expensive according to Module 4?

- A** Video → Image → Speech → Text

B Text → Speech → Image → Video

C Image → Text → Video → Speech

D Speech → Image → Video → Text

SCENARIO

A manager tells his team: "AI model capabilities are evenly distributed — every model is equally good at every task." A team member disagrees, citing Module 4.

49 What does Module 4 say about this "even distribution" claim?

A The manager is correct — all major AI models perform equally across all tasks.

B The team member is correct — capability distributions are "jagged," meaning each model has distinct strengths and weaknesses across task types.

C Capabilities are equal but only for paid subscription tiers.

D Model capabilities only differ in language support, not task type.

SCENARIO

At the end of Module 4, an instructor asks students to summarize the two main lessons from Concept 11 and Concept 12 in one sentence.

50 Which answer best captures the combined lesson of Module 4?

A AI tools are always dangerous and should be avoided in professional settings.

- B** Use only one AI tool and always grant it maximum permissions for best results.
- C** Use AI desktop tools safely by building trust incrementally, and select AI models based on task requirements while regularly re-evaluating as capabilities evolve.
- D** AI tools require no strategy — just pick any tool and let it work freely.
